Question 5

Use the display of the LandTiger to show the maze generated by the `depthFirstSearch` subroutine written in ARM assembly. You have to draw the inner and outer walls of the maze; each cell has to be represented with a proper number of pixels (for example, 16x16 pixels).

Then, draw a white square to represent the initial position inside the maze.

By using the joystick, change the current position inside the maze (if the movement is legal). For example, if you move the joystick to the right and there is not a wall towards the cell at the right, you have to move the square to the right to represent the movement.
